Note * Analysis of pesticides and PCBs in non-potable water samples by AXYS method MLA-007, with the exception of NPDES or State permitted discharges and Stormwater applications, may fall within the scope of Washington State Department of Ecology solids matrix accreditation, subject to approval of the Ecology Project Manager.

Note ** PFAS by LC-MS/MS compliant with US DoD QSM 5.1 table B-15

Legend

Y	Accreditation scope
BFR	Brominated flame retardants (non-PBDPE)
BPA and mPE	Bisphenol A and mono-Phthalate Esters
HBCDD	Hexabromocyclododecane
OC Pesticides	Organochlorine Pesticides
PAH	Polycyclic Aromatic Hydrocarbons
PBDPE	Polybrominated diphenylethers
PCB	Polychlorinated Biphenyls
PCDDF	Polychlorinated dibenzodioxins/furans
PFAS	Per- and Polyfluoroalkyl Substances
PPCP	Pharmaceutical and Personal Care Products
TBBPA	Tetrabromobisphenol A
TOP	Total Oxidizable Precursors
California DPH	California Department of Public Health, Lab ID 2911
Florida DOH	Florida Department of Health, Lab ID E871007, (NELAC Standard)
Pennsylvania DEP	Pennsylvania Department of Environmental Protection
Minnesota DOH	Minnesota Department of Health, Lab ID 232-999-430, (NELAC Standard)
New Jersey DEP	New Jersey Department of Environmental Protection, Lab ID CANA005, (NELAC Standard)
New York DOH	New York Department of Health, Lab ID 11674, (NELAC Standard)
Washington DE	Washington Department of Ecology, Lab ID C404
Virginia DGS	Virginia Department of General Services, Division of Consolidated Laboratory Services, Lab ID 460224, (NELAC Standard)
Maine DOH	Maine Center for Disease Control and Prevention, Department of Health and Human Services, Lab ID CN00003

PCB CONGENER ANALYSIS
SGS AXYS METHOD: MLA-010
4033: L29052-1 -4, -6, -7, -9, -11, -12, -16, -17 and -19

PROJECT NAME: SURFACE SEDIMENT PO# 2018-0053

Revision date: 09 August 2018
31 May 2018

Revision 09 August 2018: EDDs and report forms have been revised to correct collection dates for samples LDW18-SS-177 and LDW18-SS-180 (AXYS ID L29052-9 and -12, respectively). No other changes have been made to the data.

NARRATIVE

This narrative describes the analysis of ten solid samples for the determination of polychlorinated biphenyl (PCB) congeners using high resolution gas chromatography/high resolution mass spectrometry (HRGC/HRMS).

SAMPLE RECEIPT AND STORAGE

The samples were received on the 14th of March 2018. Details of sample conditions upon receipt are provided on the Sample Receiving Record forms included in this data package. The samples were stored at -20°C in dark prior to extraction and analysis.

SAMPLE PREPARATION AND ANALYSIS

The samples were prepared and homogenized as documented in Sample Composite Preparation Records and Sample Homogenization Records sections in the data package.

Extraction and analysis procedures were in general accordance with **USEPA Method 1668, Revision C** as documented in SGS AXYS Method MLA-010. A summary of the SGS AXYS method, MSU-010, with a list of modifications of USEPA Method 1668C are included following this narrative.

The samples and QC samples (a procedural blank and a known sample called Ongoing Precision and Recovery (OPR)) were analyzed in a batch named WG63753. Sample LDW18-SS-184 (AXYS ID L29052-16) was analyzed in duplicate and the duplicate was assigned AXYS ID WG63753-103. A standard reference material (NIST SRM 1493) was also analyzed in the batch and designated AXYS ID WG63753-104. The composition of the batch is shown on the Correlation Table and Batch list forms included in this data package

Clean sand was used as the matrix for the Lab Blank and OPR.

Approximately 10 g (dry weight) sub-sample of each sample was accurately weighed, spiked with ^{13}C-labeled PCB quantification standards and Soxhlet extracted with dichloromethane. After spiked with ^{13}C-labeled PCB cleanup standards, the sample extracts were cleaned up on acid/base Silica, Florisil and Alumina and Biobead (gel permeation, size exclusion) chromatographic columns. The cleaned extracts were reduced in volume and spiked with labeled recovery (internal) standards prior to instrumental

analysis. The final extract volume was 20 µL except 50 µL for the SRM (AXYS ID WG63753-104); 1 µL was injected.

CALCULATIONS

Target analyte concentrations were determined by isotope dilution or internal standard quantification procedures using Micromass OPUSQuan software. Formulae used in the conversion of the raw chromatograms to concentrations are provided in the method summary documents.

Sample specific detection limits (SDLs) were determined from the analysis data following the same procedures used to convert target peak responses to concentrations. In cases when the software selected unrepresentative areas for detection limit calculations, the data validation chemists made corrections; these corrections were hand noted on the quantification report pages and/or documented on the audit change reports.

Because of instrument variability and lab background levels, it is SGS AXYS's policy to report detection limits no lower than 0.5 pg absolute (0.05 pg/g on a 10 g sample). In cases where a detection limit is observed to be less than 0.5 pg absolute, the SDL is raised to 0.5 pg absolute. This is reflected on the analysis report forms.

Homologue totals were obtained by summing the concentration of all detected congeners at each level of chlorination. Toxic Equivalents (TEQs) were calculated using WHO 2005 MAMM TEFs. The homolog total and TEQ calculations included congener peaks that did not meet the method ion abundance ratio criteria .

REPORTING CONVENTIONS

The AXYS contract number assigned for internal tracking was 4033. The samples were assigned a unique laboratory identifier of the form L29052-XX, where X is a numeral; all data reports reference this unique AXYS ID plus the client sample identifier. To assist in locating data, a table correlating AXYS ID with the client sample number is also included in this data package.

Any extra work required and performed after the initial instrumental analysis of the sample's extract is given an extra "test suffix" code. The single letter code per extra work performed is added to the AXYS sample ID as a suffix, and is combined with any other applicable test suffix codes. The extra work code used to report data in this package include:

K = refortification of sample extract with labeled recovery (internal) standards followed by re-analysis on instrument.

The following laboratory qualifier flags were used in this data package:

B = analyte detected in the blank, and analyte in sample is less than 10X the blank level
C = co-elution of congeners
Cx = co-elutes with the indicated congener 'x'. Data are reported against the indicated congener (which is always the lowest IUPAC-designated congener of the co-elution)
G = presence of lock-mass disturbance
J = indicates an estimated value where the concentration of the analyte is less than the LMCL but greater than the SDL
K = identifies a target that could not be confirmed by virtue of not satisfying all method required criteria, the reported value may be interpreted as an estimated maximum possible concentration.
U = identifies a compound that was not detected.

Analysis results for each sample are provided on Analysis Report form 1A and form 2. Results are reported in concentration units of picograms per gram (pg/g) on a dry weight basis to three significant figures.

QA/QC NOTES

Samples and QC samples analyzed in an analysis batch were carried intact through the entire analytical process. The sample data were reviewed and evaluated in relation to the batch QC samples.

- Sample analyte concentrations are not blank corrected. Sample data should be evaluated with consideration of analyte levels in the Lab Blank (AXYS ID WG63753-101).
- By virtue of the isotope dilution/internal standard quantification procedures, data are recovery corrected for possible losses during extraction and clean up procedures.
- All linearity, CAL/VER, Lab Blank, OPR and labeled compound recovery specifications were met with the following exceptions:

  PCB 169 concentration in closing calibration verification PB8C_173 S: 10 was above the method upper control limit. Given that PCB 169 was not detected in all client samples, sample PCB 169 data was not impacted by the variance.

  RPD values for PCB 1, 3, 12, 194, 195 and 207 between samples LDW18-SS-184 and LDW18-SS-184 Duplicate (AXYS ID L29052-16 and WG63753-103, respectively) were above the method control limit 40. The variances are considered due to the inhomogeneity of the sample matrix.

Puget Sound reference material (AXYS ID L28776-3) was also included in the workgroup but it was lost due to a lab accident. Therefore, data for the reference material was not available.

Disturbances of the mass ions used to monitor instrument performance (lock-mass) were observed at the retention times corresponding to PCB 2, 32, 42, 49/69, 55, 89 and/or 156/157 in samples LDW18-SS-169, LDW18-SS-172, LDW18-SS-174, LDW18-SS-175, LDW18-SS-177 and LDW18-SS-185 (AXYS ID L29052-1, -4, -6, -7, -9 and -17, respectively). The congeners were flagged with a 'G'. As the disturbances only affected congeners that are small contributors to the overall total, data were not considered affected by the variances.

Relative retention times (RRTs) for PCB 32, 42, 43, 44/47/65, 45/51, 46, 48, 50/53, 52, 55, 64, 66, 84, 88/91, 89, 126 and/or 127 in samples LDW18-SS-172, LDW18-SS-177, LDW18-SS-179, LDW18-SS-180, LDW18-SS-184, LDW18-SS-185, LDW18-SS-187 and LDW18-SS-184 Duplicate (AXYS ID L29052-4, -9, -11, -12, -16, -17, -19 and WG63753-103, respectively) were slightly outside of the nominal RRT acceptance windows printed on Form 3A/B or 6A. But these congeners were determined to be present based on a detailed inspection of sample and calibration chromatogram patterns.

Peaks for PCB 81, 123 and 126 in all client samples were on the tail or shoulder of a larger peak and there was no obvious valley between the two peaks. As a result, those congeners were flagged with a 'K' though their ion abundance ratios were within the method control limits in some samples. The reported values should be interpreted as estimated maximum possible concentrations.

The analyst noted on the lab workup sheets that the extract for sample LDW18-SS-185 (AXYS ID L29052-17) went dryness in evaporation process. As recoveries of all labeled surrogates were within method control limits and sample analytes were quantified using isotope dilution method, sample data were not impacted by the variance.

ANALYTICAL DISCUSSION

Data obtained in initial analysis indicated that recovery (internal) standards were inadvertently not spiked into the extract for sample LDW18-SS-169 (AXYS ID L29052-1). The sample extract was fortified with recovery standard followed by re-analysis on instrument. Data obtained in the analysis of fortified extract was reported for the sample (indicated by the suffix 'K' on the AXYS ID). Analyte data was not impacted by this kind of variance.

DATA PACKAGE

This data package is assigned a unique identifier, DPWG64016, shown on the front page of this data package. Includes the following documentation after this narrative:

- Method summary (MSU-010)
- Sample Correlation Table
- Sample receiving documentation
- Sample composite preparation records
- Sample homogenization records
- Laboratory extraction logs for each sample
- Sample data reports (in order of AXYS Sample ID)
- Laboratory QC data reports
- Instrumental QC data reports and Mass resolution printouts (in order of analysis date)
- Audit change reports
- Sample chromatograms (in order of AXYS Sample ID)
- Laboratory QC chromatograms
- Instrumental QC chromatograms (in order of analysis date)
- Accreditation Scope

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, except for the conditions detailed above. In addition, I certify, that to the best of my knowledge and belief, the data as reported are true and accurate. The following signature, on behalf of SGS AXYS Analytical Services Ltd, authorizes the release of the data contained in this data package.

SGS AXYS Analytical Services Ltd.

SUMMARY OF SGS AXYS METHOD MLA-010 REV. 12 VER. 01:

ANALYTICAL METHOD FOR THE DETERMINATION OF 209 PCB CONGENERS BY EPA METHOD 1668A, EPA METHOD 1668C OR EPA METHOD CBC01.2

This analytical method determines the concentrations of all 209 PCB congeners in sediment, soil, sludge, tissue (including blood), aqueous samples, milk, solvent extracts, air samples and XAD-2 columns by high resolution gas chromatography and mass spectrometry (HRGC/HRMS). For EPA Method 1668A applications PCBs are reported using the congener numbering convention used in Method 1668A, for EPA Method 1668C and EPA Method CBC01.2 applications PCBs are reported using the congener numbering convention in EPA Method 1668C.

The concentrations of some PCB congeners are reported as the sum of two or more congeners due to coelution of the congeners. The coeluting congeners are listed below.

COELUTING PCB CONGENERS	
PCB 12, 13	PCB 93, 95, 98, 100, 102
PCB 30, 18	PCB 107, 124 (1668A) or PCB 108, 124 (1668C)
PCB 20, 28	PCB 110, 115
PCB 21, 33	PCB 128, 166
PCB 26, 29	PCB 129, 138, 160, 163
PCB 40, 41, 71	PCB 134, 143
PCB 44, 47, 65	PCB 135, 151, 154
PCB 45, 51	PCB 139, 140
PCB 49, 69	PCB 147, 149
PCB 50, 53	PCB 156, 157[1]
PCB 59, 62, 75	PCB 153, 168
PCB 61, 70, 74, 76	PCB 171, 173
PCB 83, 99	PCB 183,185
PCB 85, 116, 117	PCB 180, 193
PCB 86, 87, 97 108, 119, 125 (1668A) or PCB 86, 87, 97 109, 119, 125 (1668C)	PCB 197, 200
PCB 88, 91	PCB 198, 199
PCB 90, 101, 113	

[1] A second GC/MS analysis on a DB-1 column (30 m, 0.25 mm I.D., 0.25 μm film thickness) resolves the PCB 156/157 coeluting pair. This second analysis is performed upon request by the client.

The concentrations of all other PCB congeners are reported as the concentration of individual congeners.

A subset of congeners designated as “toxic” by the World Health Organization, can be reported with the associated toxic equivalents.

SGS AXYS Analytical Services Ltd.

WHO TOXIC PCB CONGENERS	CONGENER NUMBER
3,4,4',5-Tetrachlorobiphenyl (TeCB)	81
3,3',4,4'-TCB	77
2,3,3',4,4'-Pentachlorobiphenyl (PeCB)	105
2,3,4,4',5-PeCB	114
2,3',4,4',5-PeCB	118
2',3,4,4',5-PeCB	123
3,3',4,4',5-PeCB	126
2,3,3',4,4',5-Hexachlorobiphenyl (HxCB)	156
2,3,3',4,4',5'-HxCB	157
2,3',4,4',5,5'-HxCB	167
3,3',4,4',5,5'-HxCB	169
2,3,3',4,4',5,5'-HpCB	189

Upon client request, any subset of the 209 PCB congeners may be reported.

1.0 EXTRACTION AND CLEANUP PROCEDURES

All samples are spiked with ^{13}C-labelled surrogate standards prior to extraction and extracted as per the table below. Optional extraction procedures are shown within parentheses.

Matrix	Extraction
Aqueous	≤1% suspended solids: Liquid-liquid extraction with dichloromethane. >1% suspended solids: The sample is centrifuged prior to extraction and the particulate fraction is separately extracted by Soxhlet extraction with dichloromethane. The filtrate is liquid-liquid extracted with dichloromethane. The two extracts are then combined.
Solid (sediment, soil, sludge, particles on filter paper)	Soxhlet extraction with dichloromethane (Optional: Dean-Stark Soxhlet extraction with toluene, or Soxhlet extraction with 1:1 hexane:acetone)
Tissue	Soxhlet extraction with dichloromethane (Optional: Base digestion and liquid-liquid extraction with hexane)
Whole blood/serum/plasma	Liquid-liquid extraction with ethanol:hexane:saturated ammonium sulphate.
Milk	Liquid-liquid extraction with acetone and hexane.

This document is the Intellectual Property of SGS AXYS Analytical Services Ltd. and contains Proprietary and Confidential Business Information. It may not be reproduced or distributed without written permission of the owner. © SGS AXYS Analytical Services Ltd., 2017.
SGS AXYS Analytical Services Ltd., 2045 Mills Road W., Sidney, BC, Canada, V8L 5X2. Tel. (250) 655-5800, fax (250) 655-5811.
This is not a controlled document; it is subject to change without notification.

XAD-2 column and filter	XAD-2 adsorbent is dried and Soxhlet extracted with dichloromethane (optional Dean-Stark Soxhlet extraction with toluene). The filter is extracted by Dean-Stark Soxhlet extraction using toluene.
Ambient air (PUF and filter)	The PUF and filter(s) are Soxhlet extracted together using dichloromethane
Stationary Source Air Samples (Stack Gas sample trains)	The filter and XAD-2 adsorbent is dried and extracted by Soxhlet with toluene/acetone. Equipment rinsates are collected, dried and transferred to the round bottom flask of the Soxhlet apparatus of the XAD-2 and filters and extracted.

Extracts are routinely cleaned up using the following chromatography columns:

Multi-layered Acid/Base Silica
Alumina
Florisil

Extracts may additionally be cleaned up using some or all of the following procedures as necessary:

Column chromatography on Biobeads
Column chromatography on 4.5% carbon/Celite

2.0 INSTRUMENTATION

Instrumental analysis is performed on a SPB-Octyl capillary gas chromatographic column coupled to a high-resolution mass spectrometer (HRMS). Selected PFK ions are used as a reference for mass lock. Two masses from the molecular ion cluster are used to monitor each of the target analytes and ^{13}C-labelled surrogate standards.

Upon client request resolution of the PCB 156/157 co-elution is achieved using a DB-1 chromatography column.

Analysis of the extract on either a DB-1 or DB-5 column is useful to resolve potential interferences with PCB 169 (from PCB 190).

3.0 CALIBRATION

Initial calibration is performed using a 5 or 6 point calibration series of solutions that encompass the working concentration range. Initial calibration solutions contain the suite of labelled surrogate and recovery standards and natives listed in the table below. Calibration procedures use the mean RRFs determined from the initial calibration to calculate analyte concentrations. Calibration is verified at least once every 12 hours by analysis of a mid-level calibration solution. The mid level

calibration solution contains 209 PCB congeners and is used to establish the relative response factors and retention times for those PCB congeners not present in the multi-level standards solutions.

Alternately clients may request initial calibration be performed using a six point calibration series of solutions if lower detection limits are required (CS 0.2).

4.0 QUANTIFICATION PROCEDURES

Analyte Identification

A chromatographic peak is identified as a target compound if the following criteria are met for the quantification and confirmation ions (where confirmation ions are available):

- Peak responses must be at least 2.5 times the background noise level.
- All peaks are acquired in the appropriate acquisition windows, when compared to the window standard.
- Peak centroids for the quantification and confirmation ions must coincide within two seconds.
- The relative ion abundance ratios must be within 15% of the expected ratio.

Calculations

Refer to Section 17.0 of EPA Method 1668A or 1668C for details of quantitative determination.

Aroclor equivalent concentrations may be calculated by converting the summed concentrations of a suite of characteristic PCB congeners to concentrations using empirical factors determined from the analysis of Aroclor mixtures.

Aroclor 1016[1] =	The sum of PCBs 8, 18/30, 31, 28/20 concentrations multiplied by 2.7;
Aroclor 1221 =	The sum of PCBs 1, 3, 8 concentrations multiplied by 1.4;
Aroclor 1232 =	The sum of PCBs 1, 3, 18/30 concentrations multiplied by 3.4;
Aroclor 1242[1] =	The sum of PCBs 8, 18/30, 31, 28/20 concentrations multiplied by 3.0;
Aroclor 1248 =	The sum of PCBs 44/47/65, 49/69, 66 concentrations multiplied by 6.1;
Aroclor 1254 =	The sum of PCBs 86/87/97/**108**/119/125, 83/99 concentrations multiplied by 8.0 (for EPA 1668A); OR The sum of PCBs 86/87/97/**109**/119/125, 83/99 concentrations multiplied by 8.0 (for EPA 1668C);
Aroclor 1260 =	The sum of PCBs 183/185, 180/193, 170 concentrations multiplied by 5.0;

Environmental samples with no clearly identified Aroclor signature are quantified as 1242/1254/1260 mixtures. Results may be reported as Aroclor 1248 instead of Aroclor 1242 and 1254 where the congener pattern clearly indicates this formulation. Other Aroclor formulations may be reported by calibration against the specific Aroclor solutions.

[1] Aroclors 1016 and 1242 may be reported as combined 1016/1242 using the 1242 factor

4.1 Reporting Limits

Concentrations and detection limits for target compounds are reported. The isotope dilution/internal standard method of quantification, used to determine concentrations of target analytes, corrects the concentrations based on the percent recovery of the surrogate. Typical reporting units are pg/g, pg/L, or pg/sample. Concentrations for solids are reported on a dry weight basis. Concentrations in tissues (including blood/serum/plasma and milk) are reported on a wet weight basis and/or on a lipid weight basis when requested. Concentrations in aqueous samples are reported on a volume basis. Concentrations in XAD-2 resin, filters and stack gas samples are reported on a per sample basis or a per volume basis. Concentrations in particulate filters are reported on a per sample basis. Results may be expressed in other units if specified by contract. Unless otherwise specified, concentrations are reported to three significant figures.

Percent moisture is reported for all sediments, soils, and ash samples and for tissues when percent moisture is requested. Percent moisture is not reported for pulps and sludge, although it is determined for the calculation of a dry weight.

Percent lipid is reported if determined on a sample.

Various reporting limit options are offered to meet particular client and data quality objectives and should be defined specific to contract by the client and agreed to by SGS AXYS in advance of instrumental analysis:

Sample Specific Detection Limit (SDL) Reporting Limit

SDLs are determined from the analysis data by converting the minimum detectable area to a concentration following the same quantification procedures used to convert target peak responses to concentrations. The estimated minimum detectable area is determined as 2.5 times the height of the noise in the m/z channel of interest, converted to an area using the area:height ratio of the corresponding labelled surrogate peak. The SDL accounts for any effect of matrix on the detection system, for recovery achieved through the analytical work-up and for the exact sample size used.

SDLs do not account for background contribution, and sample results must be compared to the associated QC blank results for significance of detection.

The lower reporting limit for blood/serum/plasma samples is the SDL, for other matrices the lower reporting limit is the greater of SDL or 0.5 pg/sample.

EPA1668A and EPA1668C Specified Reporting Limit

An alternate reporting limit approach may be applied on written request of the customer: sample results are reported to minimum levels (“MLs”) according to section 17.6.1.4 of EPA methods 1668A/C. Depending on client request, the MLs used may be the MLs listed in 1688A/C or laboratory MLs. Laboratory MLs are determined as the greater of the low calibration equivalent or of the (mean + 2 standard deviations) values of laboratory blank concentrations. Values for laboratory blanks are updated annually for aqueous, solid and tissue sample matrices, using a minimum of 10 consecutively processed blanks representative of typical lab performance.

MLs do not account for sample specific matrix effect or sample specific recovery achieved through the analytical work-up. ML reporting limits do account for background detectable in laboratory blanks. ML reporting limit is a recognized convention for compliance monitoring based on Total PCB

values determined from summation of detected congeners.

The blank statistics are retained on file. QC blank results are reported to the SDL.

Laboratory Method detection limit (MDL) Reporting Limit

Laboratory MDLs are determined as specified by EPA Fed. Reg. 40 CFR Part 136 Appendix B (no iteration option). The 99% confidence level MDL is statistically determined based on analysis of a minimum of 7 replicate matrix spikes fortified at 1-5 times the estimated detection limit. MDLs are an estimate of detection limit determined at a point in time and do not compensate for sample specific matrix effect, sample specific recovery achieved through the analytical work-up; an implicit assumption of the MDL procedure followed is that blank results are centered around zero, and consequently, MDLs may not adequately account for background contribution as evidenced in QC blanks.

5.0 QUALITY ACCEPTANCE CRITERIA

Samples are analyzed in batches consisting of a maximum of twenty samples, one procedural blank and one spiked matrix (OPR) sample. A duplicate is analyzed, provided there is sufficient sample, with batches containing 7-20 samples. Matrix spike/matrix spike duplicate (MS/MSD) pairs may be analyzed on an individual contract basis. The batch is carried through the complete analytical process as a unit. For sample data to be reportable, the batch QC data must meet the established acceptance criteria presented on the analysis reports.

SGS AXYS Analytical Services Ltd.

QC Specification Table: **QC Samples, Instrumental Analysis, and Analyte Quantification**

QC Parameter	Specification
Analysis Duplicate	Must agree to within ±20% of the mean (applicable to concentrations >10 times the DL)[1]
Procedural Blank	Analyte amounts in blank samples for PCB congeners 77, 81, 114, 123, 126 and 169 must be ≤ 2 pg/congener/sample, amounts of PCB congeners 156, 157, 167 and 189 must be ≤ 10 pg/congener/sample, and the maximal amount of PCB 11 must be ≤ 150 pg/sample. Amounts of all other individual PCB congeners or coelutions must be ≤ 50 pg/congener/sample in blank samples. The sum of all 209 congeners should be ≤ 300 pg/sample. Higher levels are acceptable where sample concentrations exceed 10 times the blank levels.
Sample Specific Detection Limit	Typical sample specific detection limits, determined from chromatographic noise, are in the range of 0.5 to 2.0 pg.
Initial Calibration	For 6- or 7-point calibration, a relative standard deviation of the RRF's ≤20% for all compounds. Ion ratios for all congeners must be within ±15% of theoretical for CS-0.2. Minimum S:N ratio 10:1 for all calibration standards. For CS-0.2, S:N ratio may be as low as 3:1 for di-PCBs and nona-PCBs. If the optional CS-6 calibration point fails, calibration may still be performed using the default CS-0.2 through CS-5 calibration range.
Continuing CAL VER	Refer to the tables above.
Analyte/Surrogate Ratios	Response must be within the calibrated range of the instrument. Coders may use data from more than one chromatogram to get the responses in the calibrated range.
Ion Ratios	Ion ratios must fall within ±15% of the theoretical values for positive identification of all targets in the calibration standards and samples.
Sensitivity	Refer to the S:N limits in "Initial Calibration" above.

[1] Duplicate criterion is a guideline; final assessment depends upon sample characteristics, overall batch QC and on-going lab performance.

SGS AXYS Analytical Services Ltd.

Summary of Modifications to EPA Methods 1668A and 1668C

The following sections of EPA Methods 1668A and 1668C have been modified as described below.

Section 4.2.1, 4.2.2: The protocol for washing reusable glassware includes a detergent wash, water rinse and baking at a minimum of 300°C for 8 hours. Immediately prior to use, glassware is solvent rinsed with toluene and hexane.

Section 4.7: The first cleanup column for tissue extracts is a gravity gel permeation column (SX-3 Biobeads). An anthropogenic isolation column 7.5.3 is not used.

Section 6.5.1: Glass wool is cleaned by rinsing twice with toluene and twice with hexane.

Section 7.12, 7.13, 9.0, 11.0: The concentration of the labelled toxics/LOC and the cleanup standard spiking solutions is 100 ng/mL and the sample spiking volume is 20 µL. The resulting final concentrations in the extracts are as specified in the method.

Section 7.14: Concentration of the labelled injection internal standard spiking solution (recovery standard) is modified so that a volume of 5 µL is added. The resulting amount of standard added to the final extract is the same as specified in the method. The solution is spiked into a 15 µL extract volume for a final extract volume of 20 µL.

Section 7.2.1: Sodium sulphate is baked at a minimum of 300°C for 8 hrs.

Section 7.5.1: Silica is activated by baking at 450°C in a muffle oven for at least 8 hrs.

Section 7.5.4.1.1: Florisil is baked at 450°C in a muffle over for at least 8 hrs, then deactivated with water to 2.0 % deactivation.

Section 10.3.3, 15.3.3: A S:N ratio of 3:1 for di-PCBs and nona-PCBs in CS0.2 calibration solution is acceptable.

Section 11.3, 11.5.7, 11.7: To avoid carry-over contamination particles larger than 1 mm in solid samples are by default not subject to grinding prior to extraction. Instead solid samples are homogenized prior to sub-sampling by breaking up clumps with a disposable spoon and mixing/stirring. If required by the client rocks larger than 0.4 cm are removed. Surrogate standard is added after homogenization and sub-sampling.

Section 11.5.6: Unless requested by the client, the aqueous portion after filtration of aqueous samples with >1% solids is not discarded but is extracted.

Section 11.5, 11.5.2, 11.5.5, 12.3 Solid samples are dried by mixing with anhydrous sodium sulphate. The dried solid is extracted using a Soxhlet extraction apparatus. The surrogate

SGS AXYS Analytical Services Ltd., 2045 Mills Road W., Sidney, BC, Canada, V8L 5X2. Tel. (250) 655-5800, fax (250) 655-5811.
This is not a controlled document; it is subject to change without notification.

spike is incorporated after the drying step. Equilibration time for the surrogate is 30 minutes. The extracting solvent for solids is dichloromethane.

Section 12.4, 11.8: The surrogate spike is incorporated into the sample after the drying step to eliminate the possibility of disproportional loss of volatile labelled and target compounds.

Section 12.4.2: The precleaning of the Soxhlet apparatus is carried out using toluene instead of dichloromethane, for 2 hours.

Section 12.4.9: Lipid analysis is carried out by sub-sampling two 2 g portions of the extract from a total 30 g extract weight. The cleanup standard is spiked into the extract after Soxhlet extraction and before any lipid analysis or rotary evaporation is done. The percent surrogate recoveries are corrected for the amount of extract used for lipid analysis.

Section 12.6.1.1: Rotary evaporation is done at 30°C. Daily cleaning of the rotary evaporators include dismantling and rinsing/soaking with solvent. Proofs are run periodically but are not archived daily.

Section 12.7.4: Before Florisil or alumina cleanup procedures, a solvent exchange is done by reducing under nitrogen to 300 uL and bulking up to 1mL in hexane. If toluene is present the extract is reduced to 50 uL under nitrogen and bulked up to 1 mL.

Section 12.7.7: Toluene (1 mL) is added to the eluate from the final column prior to rotary evaporation and nitrogen blow down concentration steps.

Section 13.1.1: GPC chromatography, by a gravity column, is routinely used only for tissue extracts. The GPC cleanup is optional for all other matrices.

Section 13.3.1: Routine layered silica column is as follows: 0.5 g neutral silica, 2 g 28% basic silica, 0.5 g neutral silica, 4 g 44% acidic silica, 4 g 22% acidic silica, 1 g neutral silica.

Section 13.3.4: The sample is loaded onto the column followed by 2-3 rinses of a least 1 mL, and eluted with 100mL of hexane.

Section 14.2: The volume of labelled injection internal standard (recovery standard) added to the extract is 5 µL, for a final extract volume of 20 µL. Hexane rather than nonane is used as the solvent to bring extract back to volume for re-analysis or to dilute extracts.

Section 15.3: The calibration solution containing all 209 PCB congeners is used as the CAL/VER solution.

Section 17.5: Extracts are diluted with hexane. The concentration of the labelled injection internal (recovery) standard is not re-adjusted to 100 pg/µL when dilutions are performed.

SGS AXYS Analytical Services Ltd.

Section 17.0

$Conc_i$ - the concentrations of target analytes, and the labelled compound concentrations and recoveries, are calculated using the equations below. These procedures are equivalent to those described in the method but are more direct.

$$Conc_i = \frac{A_i}{A_{si}} \times \frac{M_{si}}{RRF_{i,si}} \times \frac{1}{M_x}$$

where A_i = summed areas of the primary and secondary m/z's for the analyte peak of interest (compound *i*)

A_{si} = summed areas of the primary and secondary m/z's for the labelled surrogate peak used to quantify *i*)

M_x = mass of sample taken for analysis

M_{si} = mass of labelled surrogate (compound *si*) added to sample as calculated by the concentration of standard spiked (pg/mL) multiplied by the volume spiked (mL)

$RRF_{i,si}$ = mean relative response factor of *i* to *si* from the five-point calibration range and defined individually as:

$$\frac{A_i}{A_{si}} \times \frac{M_{si}}{M_i}$$

Calculation of Surrogate Standard Concentrations and Percent Recoveries:
Concentrations of surrogate standards are calculated using the following equation:

$$Conc_{si} = \frac{A_{si}}{A_{rs}} \times \frac{M_{rs}}{RRF_{si,rs}}$$

and, the percent recoveries of the surrogate standards are calculated using the following equation:

$$\%\text{Recovery} = \frac{A_{si}}{A_{rs}} \times \frac{M_{rs}}{RRF_{si,rs}} \times \frac{1}{M_{si}} \times 100$$

where A_{rs} and A_{si} are the summed peak areas (from the primary and secondary m/z channels) of recovery standard and labelled surrogate added to the sample;
M_{rs} and M_{si} are the masses of recovery standard and labelled surrogate added to the sample, and;
$RRF_{si,rs}$ is the mean relative response factor of the labelled surrogate to the recovery standard as determined by the five-point calibration range and defined individually as:

$$\frac{A_{si}}{A_{rs}} \times \frac{M_{rs}}{M_{si}}$$

Brooks, Georgina (Sidney)

From: Amara Vandervort <amarav@windwardenv.com>
Sent: Wednesday, April 25, 2018 4:11 PM
To: Brooks, Georgina (Sidney)
Subject: Ex-situ PCB Congener sediment and passive sampler analyses
Attachments: Porewater Sample Analysis Summary.xlsx

Hello,

EPA has approved the proposed list of passive samplers and corresponding sediment samples to be analyzed for PCB congeners. I have enclosed a table identifying which samples have been selected for analysis. Please let me know if you have any questions. Thanks!

Regards,
Amara

Table 1. Data summary for potential PCB porewater evaluation samples

Sample ID	River Mile	Total PCB Aroclors (µg/kg dw)	Total Organic Carbon (%)	OC-Normalized Total PCBs (mg/kg-OC)	Black Carbon (%)	Selected?
LDW18-SS-188	5	18 U	0.45	4.0	nd	
LDW18-SS-174	0.7	49.1	0.89	5.5	nd	x
LDW18-SS-170	0.6	56.3	0.41	13.7	nd	
LDW18-SS-186	3.9	56.5	1.31	4.3	nd	
LDW18-SS-187	4.5	65.3	1.14	5.7	nd	x
LDW18-SS-184	3	102	0.98	10.4	nd	x

SAMPLE TRANSFER FORM

This form is to be used by Chemists in the Lab Services area when transferring a sample from a broken or damaged sample container to another container.

Date	Analyst
14MAR2018	CMM
SGS AXYS Sample ID	**Contract Number**
L29052-10	4033

Jar or Container Number : 1 of 1 ☐ AGRICULTURAL HAZARD

Description of Damage :
broken jar

Reason for Breakage :
☑ Freezing/Thawing ☐ Shipping Other: _____

Physical Description of Sample :
☑ Wet Solid ☐ Tissue Colour: gray - black
☐ Dry Solid ☐ Blood/Serum Other: _____
☐ Moist Solid ☐ Aqueous

Containers Filled :
_____ x 60 mL Jar _____ x 500 mL Jar Other: _____
_____ x 120 mL Jar _____ x 40 mL Vial
1 x 250 mL Jar _____ x 60 mL Vial

Approximate Losses Upon Transfer :
Liquid ~2-3 mL Cloudy ☐ or Clear ☑
Solid ~3-5 g

Observations RE: Sample Integrity (see note 3)	☐ Project Chemist Informed
integrity not compromised.	

Notes to Chemist:

1. Arrange for a photocopy of the form to accompany sample back to Sample Receiving dept.
2. Scan original to the 'Reporting Sample Prep' folder. Name the document as the sample's login number. Place original in Sample Prep's scanned paperwork folder once scanned.
3. Under "Observations RE: Sample Integrity" provide a comment if the sample integrity was clearly observed to be compromised.

FOR AGRICULTURAL HAZARDS: Sample Receiving must perform LIMS entry regarding disposal of lost material.

Modified Composite Sample Preparation Record

WG: WG63336 Date: 20Mar2018 Chemist: SRM Contract: 4033

Axys Sample ID: L28776-1 Balance ID#: 3120

Sample ID for individuals	Client ID	Jar + Sample (g)	Jar (g)	Sample (g)
Original Sample	PSRM0091	83.56	49.59	33.97
				20Mar2018 SRM
	Subsamples 20Mar2018 SRM			
	L28776-1 Jar 1 of 3	100.05	88.98	11.07
	L28776-2 Jar 2 of 3	101.49	89.49	12.00
	L28776-3 Jar 3 of 3	99.73	88.86	10.87
	DCM Rinse			
	L28776-1	97.60	89.01	8.59
	L28776-2	99.04	88.79	10.25
	L28776-3	98.10	~~89~~. 88.95	9.15
			20Mar2018 SRM	
	Note: DCM rinse was taken by adding some DCM to the original containe (~2mL), vortexing,			
10APR2018 CER for SPM	and then putting the DCM (20Mar2018 SRM) in L28776-1's DCM rinsate's jar. This was done ~5 times.			
	(Jar + Sample) - (Jar) = (Sample)			
	117.69g - 89.01g = 28.68g of DCM rinsate available.			
	The DCM rinsate was then vortexed + quickly portioned out to L28776-2. The DCM			
	rinsate was vortexed again + quickly portioned out for L28776-3. The remaining DCM			
	rinsate was the portion for L28776-1			

Total sample weight after homogenization See above g

Comments:

Mix well in jar prior to subsampling

L28776-3 is 30 g of reference material received in a 100mL jar. It has been split into ~3 equal aliquots of ~10 g each. The weights were determined at the time of splitting. The original container was rinsed with solvent and the solvent spit into 3 equal portions, one for each 10 g split. Consume one portion of reference material and one portion of rinsate. Rinse the reference material jar with solvent and add to soxhlet.

For **WG63753-104 (CRM)**: Spike 20uL NIST SRM 1493 (SC3397) and SUR into microvial. During microvialling spike REC. FV=45uL.

Project No.	SURFACE SEDIMENT PO# 2018-0053		
Contract No.:	4033	**Lab Sample I.D.:**	L29052-1 K
Matrix:	SOLID	**Sample Size:**	9.96 g (dry)
Sample Receipt Date:	14-Mar-2018	**Initial Calibration Date:**	10-Nov-2017
Extraction Date:	02-May-2018	**Instrument ID:**	HR GC/MS
Analysis Date:	23-May-2018 **Time:** 01:17:16	**GC Column ID:**	SPB OCTYL
Extract Volume (uL):	20	**Sample Data Filename:**	**PB8C_176A S: 5**
Injection Volume (uL):	1.0	**Blank Data Filename:**	PB8C_172 S: 4
Dilution Factor:	N/A	**Cal. Ver. Data Filename:**	PB8C_176A S: 1
Concentration Units:	pg/g (dry weight basis)	**% Moisture:**	42.2

This page is part of a total report that contains information necessary for accreditation compliance.
Results are compliant with NELAP accreditation described in the total report. Sample results relate only to the sample tested.

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; G = lock mass interference present; C = co-eluting congener.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; J = concentration less than lowest calibration equivalent; G = lock mass interference present; C = co-eluting congener.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; B = analyte found in the associated blank and concentration in sample is less than 10X the concentration in the associated blank; J = concentration less than lowest calibration equivalent; G = lock mass interference present; C = co-eluting congener.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Suffix "L" indicates labeled compound.
(2) Where applicable, custom lab flags have been used on this report; C = co-eluting congener.
(3) R% = percent recovery of labeled compounds.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; J = concentration less than lowest calibration equivalent; G = lock mass interference present; C = co-eluting congener.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

Project No.	SURFACE SEDIMENT PO# 2018-0053		
Contract No.:	4033	**Lab Sample I.D.:**	L29052-7
Matrix:	SOLID	**Sample Size:**	9.86 g (dry)
Sample Receipt Date:	14-Mar-2018	**Initial Calibration Date:**	10-Nov-2017
Extraction Date:	02-May-2018	**Instrument ID:**	HR GC/MS
Analysis Date:	18-May-2018 **Time:** 03:55:26	**GC Column ID:**	SPB OCTYL
Extract Volume (uL):	20	**Sample Data Filename:**	**PB8C_172 S: 9**
Injection Volume (uL):	1.0	**Blank Data Filename:**	PB8C_172 S: 4
Dilution Factor:	N/A	**Cal. Ver. Data Filename:**	PB8C_172 S: 1
Concentration Units:	pg/g (dry weight basis)	**% Moisture:**	40.6

PCB HOMOLOGUE GROUP	LAB FLAG [1]	CONC. FOUND
Total Monochloro Biphenyls		144
Total Dichloro Biphenyls		4420
Total Trichloro Biphenyls		28400
Total Tetrachloro Biphenyls		57300
Total Pentachloro Biphenyls		66700
Total Hexachloro Biphenyls		57800
Total Heptachloro Biphenyls		27700
Total Octachloro Biphenyls		7160
Total Nonachloro Biphenyls		745
Decachloro Biphenyl		280
TOTAL PCBs		251000

(1) Where applicable, custom lab flags have been used on this report.
(2) All header information pertains to the initial instrumental analysis of the sample extract. Additional sample datafiles listed refer to secondary analysis of the sample extract.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; J = concentration less than lowest calibration equivalent; G = lock mass interference present; C = co-eluting congener.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags may have been used on this report; U = not detected at RL; C = co-eluting congener.
(2) On this form, concentrations that do not meet quantification criteria are reported, flagged, and used in the TEQ calculations.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; C = co-eluting congener.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; C = co-eluting congener.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; B = analyte found in the associated blank and concentration in sample is less than 10X the concentration in the associated blank; J = concentration less than lowest calibration equivalent; C = co-eluting congener.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Suffix "L" indicates labeled compound.
(2) Where applicable, custom lab flags have been used on this report; C = co-eluting congener.
(3) R% = percent recovery of labeled compounds.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; B = analyte found in the associated blank and concentration in sample is less than 10X the concentration in the associated blank; J = concentration less than lowest calibration equivalent; C = co-eluting congener.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Suffix "L" indicates labeled compound.
(2) Where applicable, custom lab flags have been used on this report; C = co-eluting congener.
(3) R% = percent recovery of labeled compounds.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; J = concentration less than lowest calibration equivalent; C = co-eluting congener.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; B = analyte found in the associated blank and concentration in sample is less than 10X the concentration in the associated blank; G = lock mass interference present; C = co-eluting congener.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

TOTAL PCBs		247000

(1) Where applicable, custom lab flags have been used on this report.
(2) All header information pertains to the initial instrumental analysis of the sample extract. Additional sample datafiles listed refer to secondary analysis of the sample extract.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; B = analyte found in the associated blank and concentration in sample is less than 10X the concentration in the associated blank; J = concentration less than lowest calibration equivalent; C = co-eluting congener.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; J = concentration less than lowest calibration equivalent; C = co-eluting congener.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Suffix "L" indicates labeled compound.
(2) Where applicable, custom lab flags have been used on this report; C = co-eluting congener.
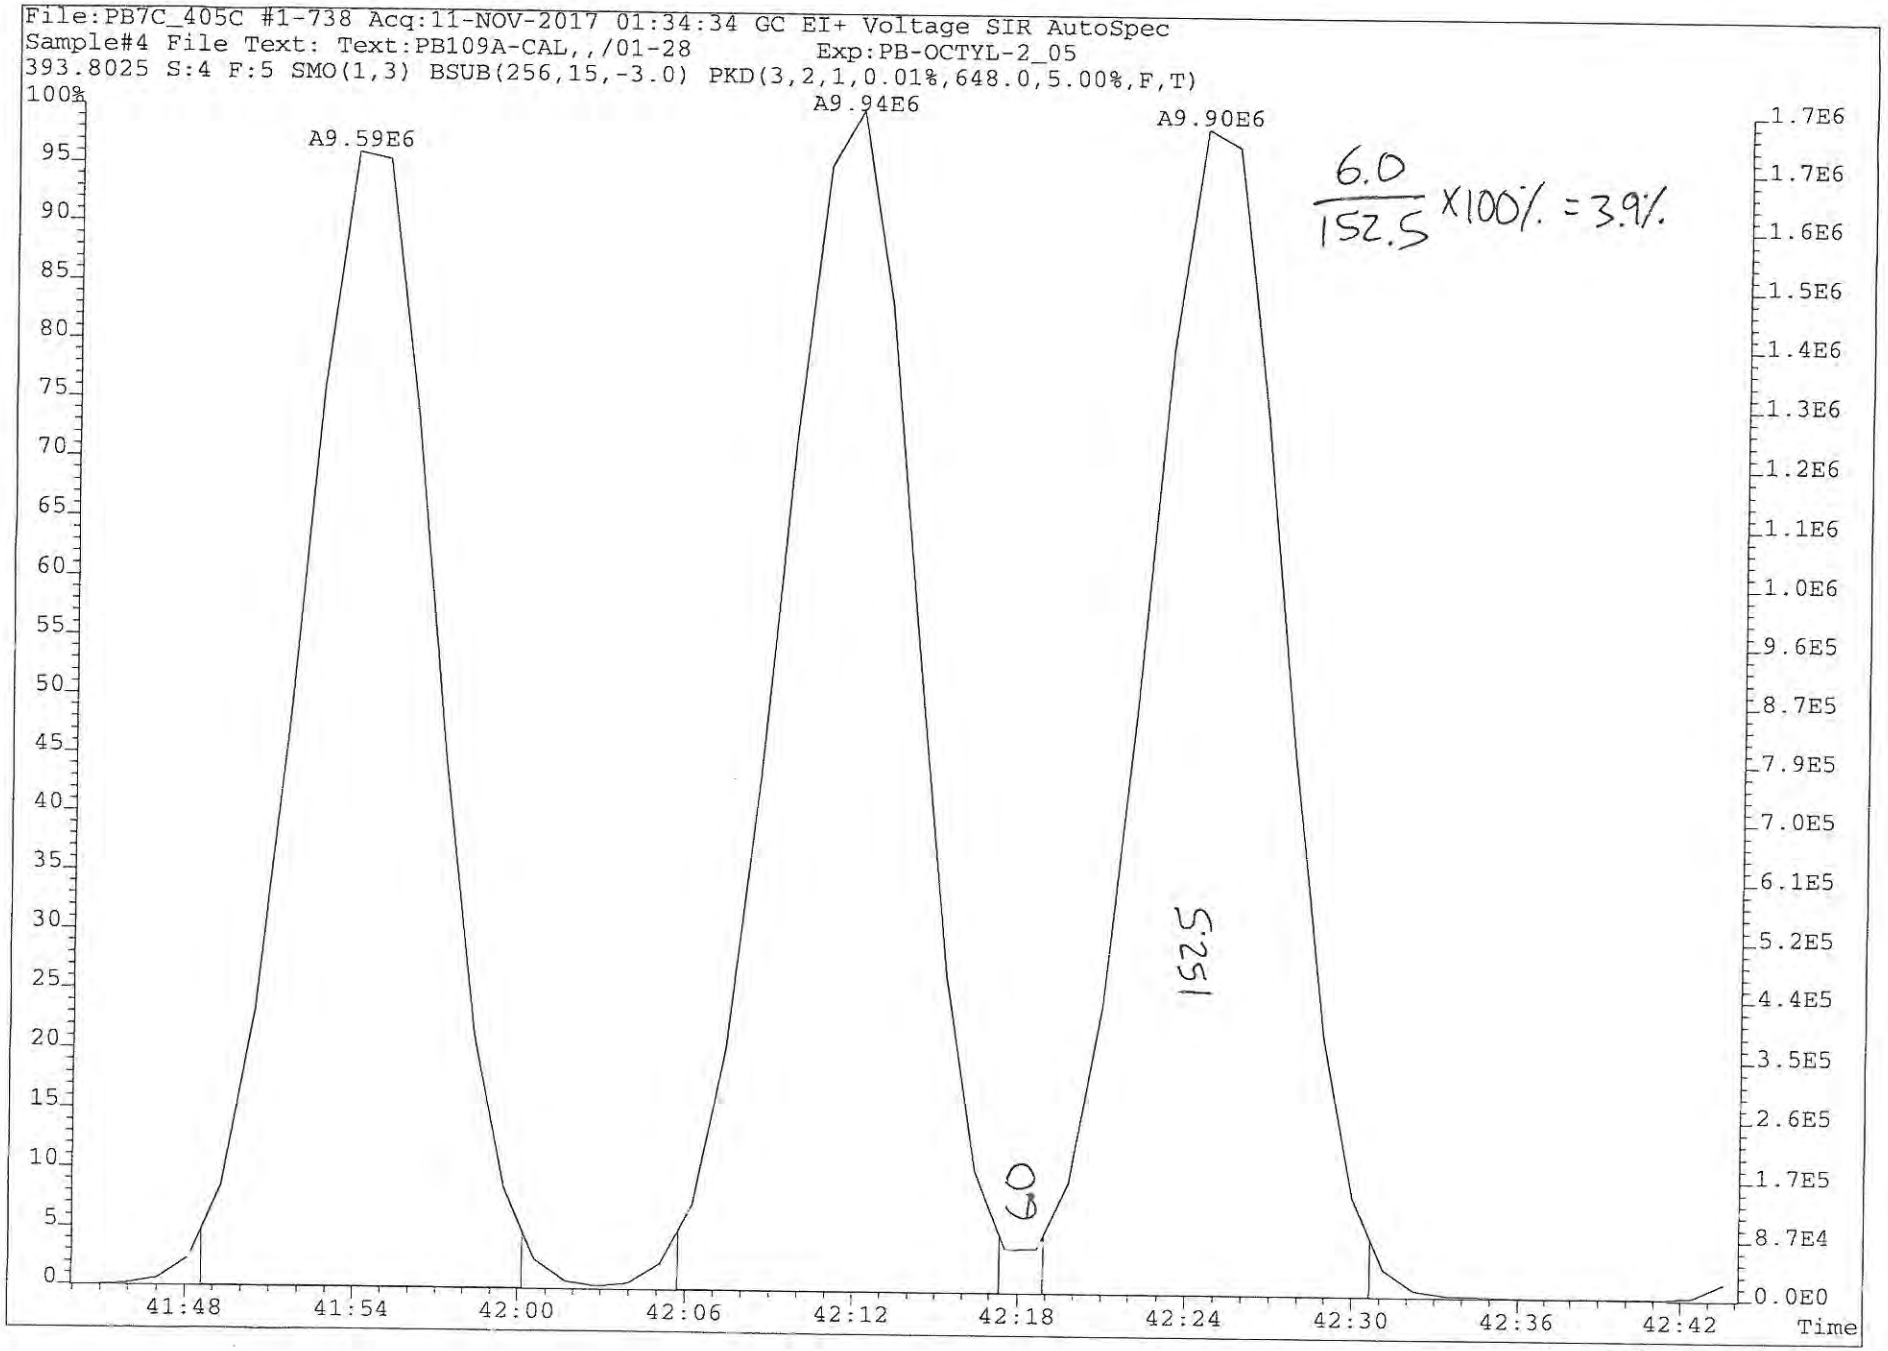
(3) See Table 8 Method 1668A for m/z specifications and ion abundance ratio control limits.



These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report.
(2) See Table 8, Method 1668A, for m/z specifications.
(3) Ion Abundance Ratio Control Limits as specified in Table 8, Method 1668A.
(4) PCB Congener numbers 107, 108, and 109 defined as per EPA1668C specifications.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Suffix "L" indicates labeled compound.
(2) Where applicable, custom lab flags have been used on this report; C = co-eluting congener.
(3) See Table 8, Method 1668A, for m/z specifications.
(4) Ion Abundance Ratio Control Limits as specified in Table 8, Method 1668A.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

04 June 2018

NARRATIVE

This narrative describes the analysis of fifteen PPSM (polyethylene passive sampling material) samples for the determination of polychlorinated biphenyl (PCB) congeners using high resolution gas chromatography/high resolution mass spectrometry (HRGC/HRMS).

SAMPLE RECEIPT AND STORAGE

Polyethylene batch SGS AXYS Lot1801 was cleaned and prepared following the procedures in SGS AXYS SOP SLA-142 Preparation of Polyethylene Passive Sampling Devices: Cleaning, Proofing and Loading with PRCs. Prepared polyethylene was shipped to the client on 7-March-2018. The Day Zero samples were logged in as AXYS ID L28862-2, -3 and -4.

The samples were received on the 17th and 24th of April 2018. Details of sample conditions upon receipt are provided on the Sample Receiving Record forms included in this data package. The samples were stored at 4°C in dark prior to extraction and analysis.

SAMPLE PREPARATION AND ANALYSIS

Extraction and analysis procedures were in general accordance with **USEPA Method 1668, Revision C** as documented in SGS AXYS Method MLA-010. A summary of the SGS AXYS method, MSU-010, with a list of modifications of USEPA Method 1668C are included following this narrative.

The samples and QC samples (a procedural blank and a known sample called Ongoing Precision and Recovery (OPR)) were analyzed in a batch named WG63778. The composition of the batch is shown on the Correlation Table and Batch list forms included in this data package

Clean PPSM was used as the matrix for the Lab Blank and OPR.

Each PPSM sample was spiked with labeled PCB quantification standards, and extracted with dichloromethane by shaking on shaker table. The resulting extract was cleaned up on acid/base silica, Alumina and Florisil chromatographic columns. The final extract was reduced in volume and spiked with labeled recovery (internal) standards prior to instrumental analysis. The final extract volume was 20µL; 1µL was injected.

CALCULATIONS

Target analyte concentrations were determined by isotope dilution or internal standard quantification procedures using Micromass OPUSQuan software. Formulae used in the conversion of the raw chromatograms to concentrations are provided in the method summary documents.

Sample specific detection limits (SDLs) were determined from the analysis data following the same procedures used to convert target peak responses to concentrations. In cases when the software selected unrepresentative areas for detection limit calculations, the data validation chemists made corrections; these corrections were hand noted on the quantification report pages and/or documented on the audit change reports.

Because of instrument variability and lab background levels, it is SGS AXYS's policy to report detection limits no lower than 0.5 pg absolute (5 pg/g on a 0.1 g sample). In cases where a detection limit is observed to be less than 0.5 pg absolute, the SDL is raised to 0.5 pg absolute. This is reflected on the analysis report forms.

Homologue totals were obtained by summing the concentration of all detected congeners at each level of chlorination. Toxic Equivalents (TEQs) were calculated using WHO 2005 MAMM TEFs. The homolog total and TEQ calculations included congener peaks that did not meet the method ion abundance ratio criteria.

REPORTING CONVENTIONS

The SGS AXYS contract number assigned for internal tracking was 4033. The samples were assigned a unique laboratory identifier of the form LXXXXX-XX, where X is a numeral; all data reports reference this unique AXYS ID plus the client sample identifier. To assist in locating data, a table correlating AXYS ID with the client sample number is also included in this data package.

Any extra work required and performed after the initial instrumental analysis of the sample's extract is given an extra "test suffix" code. The single letter code per extra work performed is added to the AXYS sample ID as a suffix, and is combined with any other applicable test suffix codes. The extra work code used to report data in this package includes:

i = instrumental re-analysis of the sample extract.

The following laboratory qualifier flags were used in this data package:

- B = analyte detected in the blank, and analyte in sample is less than 10X the blank level
- C = co-elution of congeners
- Cx = co-elutes with the indicated congener 'x'. Data are reported against the indicated congener (which is always the lowest IUPAC-designated congener of the co-elution)
- G = presence of lock-mass disturbance
- J = indicates an estimated value where the concentration of the analyte is less than the LMCL but greater than the SDL
- K = identifies a target that could not be confirmed by virtue of not satisfying all method required criteria, the reported value may be interpreted as an estimated maximum possible concentration.
- U = identifies a compound that was not detected.

Analysis results for each sample are provided on Analysis Report form 1A and form 2. Results are reported in concentration units of picograms per gram (pg/g) to three significant figures.

QA/QC NOTES

Samples and QC samples analyzed in an analysis batch were carried intact through the entire analytical process. The sample data were reviewed and evaluated in relation to the batch QC samples.

- Sample analyte concentrations are not blank corrected. Sample data should be evaluated with consideration of analyte levels in the Lab Blank (AXYS ID WG63778-101).
- By virtue of the isotope dilution/internal standard quantification procedures, data are recovery corrected for possible losses during extraction and clean up procedures.
- All linearity, CAL/VER, Lab Blank, OPR and labeled compound recovery specifications were met with the following exceptions:

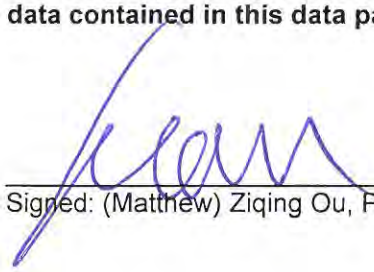
  PCB 169 concentration in closing calibration verification PB8C_176 S: 1 was above the method upper control limit. Given that PCB 169 was not detected in all client samples, sample PCB 169 data was not impacted by the variance. The concentration of cleanup standard 13C-PCB 28 in the closing calibration verification was also above the method upper control limit. As cleanup standards were not fortified to any samples in the batch, the variance was not related to sample data. Since client PRC 13C-PCB 28 was not quantified using the linearity, PRC 13C-PCB 28 data was also not related to the variance.

Disturbances of the mass ions used to monitor instrument performance (lock-mass) were observed at the retention times corresponding to PCB 187 and/or 197/200 in samples LDW18-PWPS-174 (DUP), LDW18-PWPS-SS179, LDW18-PWPS-SS172, LDW18-PWPS-SS175 and LDW18-PWPS-SS177 (AXYS ID L29196-4, -6, -13, -15 and -17, respectively). The congeners were flagged with a 'G'. As the disturbances only affect congeners that were small contributors to the overall total, data were not considered affected by the variances.

Peaks for PCB 81, 123 and 126 in samples LDW18-PWPS-SS169, LDW18-PWPS-SS174, LDW18-PWPS-174 (DUP), LDW18-PWPS-SS179, LDW18-PWPS-SS184, LDW18-PWPS-SS187, LDW18-PWPS-SS172, LDW18-PWPS-SS175, LDW18-PWPS-SS177, LDW18-PWPS-SS180 and LDW18-PWPS-SS185 (AXYS ID L29196-1, -3, -4, -6, -8, -10, -13, -15, -17, -18 and -21, respectively) were on the tail or shoulder of a larger peak and there was no obvious valley between the two peaks. As a result, these congeners were flagged with a 'K' though their ion abundance ratios were within the method control limits in some samples. The reported values should be interpreted as estimated maximum possible concentrations.

Relative retention time (RRT) for PCB 43 in samples LDW18-PWPS-SS169, LDW18-PWPS-SS174 and LDW18-PWPS-SS185 (AXYS ID L29196-1, -3 and -21, respectively) was slightly outside of the nominal RRT acceptance windows printed on Form 3A/B. But the congener was determined to be present based on a detailed inspection of sample and calibration chromatogram patterns.

ANALYTICAL DISCUSSION



As not all method specifications were met in initial analysis, extracts for samples PCB Day Zero #1, PCB Day Zero #2, PCB Day Zero #3, LDW18-PWPS-SS169, LDW18-PWPS-SS174, LDW18-PWPS-SS185, LDW18-PWPS-EXP BLK, the Lab Blank and OPR (AXYS ID L28862-2, -3, -4, L29196-1, -3, -21, -22, WG63778-101 and -102, respectively) were re-analyzed on instrument. The extract for sample LDW18-PWPS-SS169 (AXYS ID L29196-1) was instrumentally re-analyzed for a second time due to the same reason. The re-analyses were successful and the data obtained were reported for the samples (indicated by the suffix 'i' or 'i2' on the AXYS ID).

DATA PACKAGE

This data package is assigned a unique identifier, DPWG64084, shown on the front page of this data package. Includes the following documentation after this narrative:

- Method summary (MSU-010)
- Sample Correlation Table
- Sample receiving documentation
- Laboratory extraction logs for each sample
- Sample data reports (in order of AXYS Sample ID)
- Laboratory QC data reports
- Instrumental QC data reports and mass resolution printouts (in order of analysis date)
- Audit change reports
- Sample chromatograms (in order of AXYS Sample ID)
- Laboratory QC chromatograms
- Instrumental QC chromatograms (in order of analysis date)
- Accreditation Scope

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, except for the conditions detailed above. In addition, I certify, that to the best of my knowledge and belief, the data as reported are true and accurate. The following signature, on behalf of SGS AXYS Analytical Services Ltd, authorizes the release of the data contained in this data package.

SUMMARY OF SGS AXYS METHOD MLA-010 REV. 12 VER. 01:

ANALYTICAL METHOD FOR THE DETERMINATION OF 209 PCB CONGENERS BY EPA METHOD 1668A, EPA METHOD 1668C OR EPA METHOD CBC01.2

This analytical method determines the concentrations of all 209 PCB congeners in sediment, soil, sludge, tissue (including blood), aqueous samples, milk, solvent extracts, air samples and XAD-2 columns by high resolution gas chromatography and mass spectrometry (HRGC/HRMS). For EPA Method 1668A applications PCBs are reported using the congener numbering convention used in Method 1668A, for EPA Method 1668C and EPA Method CBC01.2 applications PCBs are reported using the congener numbering convention in EPA Method 1668C.

The concentrations of some PCB congeners are reported as the sum of two or more congeners due to coelution of the congeners. The coeluting congeners are listed below.

COELUTING PCB CONGENERS	
PCB 12, 13	PCB 93, 95, 98, 100, 102
PCB 30, 18	PCB 107, 124 (1668A) or PCB 108, 124 (1668C)
PCB 20, 28	PCB 110, 115
PCB 21, 33	PCB 128, 166
PCB 26, 29	PCB 129, 138, 160, 163
PCB 40, 41, 71	PCB 134, 143
PCB 44, 47, 65	PCB 135, 151, 154
PCB 45, 51	PCB 139, 140
PCB 49, 69	PCB 147, 149
PCB 50, 53	PCB 156, 157[1]
PCB 59, 62, 75	PCB 153, 168
PCB 61, 70, 74, 76	PCB 171, 173
PCB 83, 99	PCB 183,185
PCB 85, 116, 117	PCB 180, 193
PCB 86, 87, 97 108, 119, 125 (1668A) or PCB 86, 87, 97 109, 119, 125 (1668C)	PCB 197, 200
PCB 88, 91	PCB 198, 199
PCB 90, 101, 113	

[1] A second GC/MS analysis on a DB-1 column (30 m, 0.25 mm I.D., 0.25 μm film thickness) resolves the PCB 156/157 coeluting pair. This second analysis is performed upon request by the client.

The concentrations of all other PCB congeners are reported as the concentration of individual congeners.

A subset of congeners designated as “toxic” by the World Health Organization, can be reported with the associated toxic equivalents.

WHO TOXIC PCB CONGENERS	CONGENER NUMBER
3,4,4',5-Tetrachlorobiphenyl (TeCB)	81
3,3',4,4'-TCB	77
2,3,3',4,4'-Pentachlorobiphenyl (PeCB)	105
2,3,4,4',5-PeCB	114
2,3',4,4',5-PeCB	118
2',3,4,4',5-PeCB	123
3,3',4,4',5-PeCB	126
2,3,3',4,4',5-Hexachlorobiphenyl (HxCB)	156
2,3,3',4,4',5'-HxCB	157
2,3',4,4',5,5'-HxCB	167
3,3',4,4',5,5'-HxCB	169
2,3,3',4,4',5,5'-HpCB	189

Upon client request, any subset of the 209 PCB congeners may be reported.

1.0 EXTRACTION AND CLEANUP PROCEDURES

All samples are spiked with ^{13}C-labelled surrogate standards prior to extraction and extracted as per the table below. Optional extraction procedures are shown within parentheses.

Matrix	Extraction
Aqueous	≤1% suspended solids: Liquid-liquid extraction with dichloromethane. >1% suspended solids: The sample is centrifuged prior to extraction and the particulate fraction is separately extracted by Soxhlet extraction with dichloromethane. The filtrate is liquid-liquid extracted with dichloromethane. The two extracts are then combined.
Solid (sediment, soil, sludge, particles on filter paper)	Soxhlet extraction with dichloromethane (Optional: Dean-Stark Soxhlet extraction with toluene, or Soxhlet extraction with 1:1 hexane:acetone)
Tissue	Soxhlet extraction with dichloromethane (Optional: Base digestion and liquid-liquid extraction with hexane)
Whole blood/serum/plasma	Liquid-liquid extraction with ethanol:hexane:saturated ammonium sulphate.
Milk	Liquid-liquid extraction with acetone and hexane.

SGS AXYS Analytical Services Ltd., 2045 Mills Road W., Sidney, BC, Canada, V8L 5X2. Tel. (250) 655-5800, fax (250) 655-5811.
This is not a controlled document; it is subject to change without notification.

XAD-2 column and filter	XAD-2 adsorbent is dried and Soxhlet extracted with dichloromethane (optional Dean-Stark Soxhlet extraction with toluene). The filter is extracted by Dean-Stark Soxhlet extraction using toluene.
Ambient air (PUF and filter)	The PUF and filter(s) are Soxhlet extracted together using dichloromethane
Stationary Source Air Samples (Stack Gas sample trains)	The filter and XAD-2 adsorbent is dried and extracted by Soxhlet with toluene/acetone. Equipment rinsates are collected, dried and transferred to the round bottom flask of the Soxhlet apparatus of the XAD-2 and filters and extracted.

Extracts are routinely cleaned up using the following chromatography columns:

Multi-layered Acid/Base Silica
Alumina
Florisil

Extracts may additionally be cleaned up using some or all of the following procedures as necessary:

Column chromatography on Biobeads
Column chromatography on 4.5% carbon/Celite

2.0 INSTRUMENTATION

Instrumental analysis is performed on a SPB-Octyl capillary gas chromatographic column coupled to a high-resolution mass spectrometer (HRMS). Selected PFK ions are used as a reference for mass lock. Two masses from the molecular ion cluster are used to monitor each of the target analytes and ^{13}C-labelled surrogate standards.

Upon client request resolution of the PCB 156/157 co-elution is achieved using a DB-1 chromatography column.

Analysis of the extract on either a DB-1 or DB-5 column is useful to resolve potential interferences with PCB 169 (from PCB 190).

3.0 CALIBRATION

Initial calibration is performed using a 5 or 6 point calibration series of solutions that encompass the working concentration range. Initial calibration solutions contain the suite of labelled surrogate and recovery standards and natives listed in the table below. Calibration procedures use the mean RRFs determined from the initial calibration to calculate analyte concentrations. Calibration is verified at least once every 12 hours by analysis of a mid-level calibration solution. The mid level

calibration solution contains 209 PCB congeners and is used to establish the relative response factors and retention times for those PCB congeners not present in the multi-level standards solutions.

Alternately clients may request initial calibration be performed using a six point calibration series of solutions if lower detection limits are required (CS 0.2).

4.0 QUANTIFICATION PROCEDURES

Analyte Identification

A chromatographic peak is identified as a target compound if the following criteria are met for the quantification and confirmation ions (where confirmation ions are available):

- Peak responses must be at least 2.5 times the background noise level.
- All peaks are acquired in the appropriate acquisition windows, when compared to the window standard.
- Peak centroids for the quantification and confirmation ions must coincide within two seconds.
- The relative ion abundance ratios must be within 15% of the expected ratio.

Calculations

Refer to Section 17.0 of EPA Method 1668A or 1668C for details of quantitative determination.

Aroclor equivalent concentrations may be calculated by converting the summed concentrations of a suite of characteristic PCB congeners to concentrations using empirical factors determined from the analysis of Aroclor mixtures.

Aroclor 1016[1] =	The sum of PCBs 8, 18/30, 31, 28/20 concentrations multiplied by 2.7;
Aroclor 1221 =	The sum of PCBs 1, 3, 8 concentrations multiplied by 1.4;
Aroclor 1232 =	The sum of PCBs 1, 3, 18/30 concentrations multiplied by 3.4;
Aroclor 1242[1] =	The sum of PCBs 8, 18/30, 31, 28/20 concentrations multiplied by 3.0;
Aroclor 1248 =	The sum of PCBs 44/47/65, 49/69, 66 concentrations multiplied by 6.1;
Aroclor 1254 =	The sum of PCBs 86/87/97/**108**/119/125, 83/99 concentrations multiplied by 8.0 (for EPA 1668A); OR The sum of PCBs 86/87/97/**109**/119/125, 83/99 concentrations multiplied by 8.0 (for EPA 1668C);
Aroclor 1260 =	The sum of PCBs 183/185, 180/193, 170 concentrations multiplied by 5.0;

Environmental samples with no clearly identified Aroclor signature are quantified as 1242/1254/1260 mixtures. Results may be reported as Aroclor 1248 instead of Aroclor 1242 and 1254 where the congener pattern clearly indicates this formulation. Other Aroclor formulations may be reported by calibration against the specific Aroclor solutions.

[1] Aroclors 1016 and 1242 may be reported as combined 1016/1242 using the 1242 factor
