Subject: Duwamish Clam Samples for PCB Congener Analysis

Good morning,
EPA has approved the proposed list for PCB Congener analysis in the clam homogenates. The table below list the 6 samples to be analyzed and the 3 to be held. EPA will review the Aroclor and congener data after analyses is complete and would like the remaining 3 samples to be held frozen until they decide if they would like them analyzed as well, please.

(1) Where applicable, custom lab flags have been used on this report; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; J = concentration less than lowest calibration equivalent.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.
(3) Contract-required limits for RRTs and ion abundance ratios are specified in Tables 2 and 9, respectively, Method 1613.
(4) Alternate confirmation and quantitation ions used for native and labeled PECDD.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; J = concentration less than lowest calibration equivalent.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.
(3) Contract-required limits for RRTs and ion abundance ratios are specified in Tables 2 and 9, respectively, Method 1613.
(4) Alternate confirmation and quantitation ions used for native and labeled PECDD.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(2) Contract-required limits for percent recovery (R) are specified in Section 9.3.3, Method 1613.
(3) Contract-required limits for RRTs and ion abundance ratios are specified in Tables 2 and 9, respectively, Method 1613. NOTE: There is no ion abundance ratio for 37Cl4-2,3,7,8-TCDD
(4) Alternate confirmation and quantitation ions used for native and labeled PECDD.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; U = not detected at RL; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; J = concentration less than lowest calibration equivalent.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.
(3) Contract-required limits for RRTs and ion abundance ratios are specified in Tables 2 and 9, respectively, Method 1613.
(4) Alternate confirmation and quantitation ions used for native and labeled PECDD.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; J = concentration less than lowest calibration equivalent.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.
(3) Contract-required limits for RRTs and ion abundance ratios are specified in Tables 2 and 9, respectively, Method 1613.
(4) Alternate confirmation and quantitation ions used for native and labeled PECDD.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report; K = peak detected but did not meet quantification criteria, result reported represents the estimated maximum possible concentration; J = concentration less than lowest calibration equivalent.
(2) Reporting Limit (Code): S = sample detection limit; M = method detection limit; L = lowest calibration level equivalent; Q = minimum reporting level.
(3) Contract-required limits for RRTs and ion abundance ratios are specified in Tables 2 and 9, respectively, Method 1613.
(4) Alternate confirmation and quantitation ions used for native and labeled PECDD.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(3) Alternate confirmation and quantitation ions used for native and labeled PECDD.
(4) Response ratios are calculated relative to the labeled analogs of the other two HXCDDs (Section 17.1.2, Method 1613).
(5) Response ratios are calculated relative to the labeled analog of OCDD (Section 17.1.1, Method 1613).

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

(1) Where applicable, custom lab flags have been used on this report.
(2) See Table 8, Method 1613, for m/z specifications.
(3) Ion Abundance Ratio Control Limits as specified in Table 9, Method 1613.
(4) Contract-required concentration range as determined from the percent of the test concentration in Table 6, Method 1613, under VER.
(5) Alternate confirmation and quantitation ions used for native and labeled PECDD.
(6) No ion abundance ratio for 37Cl4-2,3,7,8-TCDD; concentration reported.

These data are validated and reported as accurate and in accord with SGS AXYS Analytical Services Ltd. ISO17025 compliant quality assurance processes.

NARRATIVE

This narrative describes the analysis of eighteen solid samples (17 field samples and one reference sample) for polychlorinated dibenzodioxins and dibenzofurans using high resolution gas chromatography / high resolution mass spectrometry (HRGC/HRMS).

SAMPLE RECEIPT AND STORAGE

The seventeen fields samples were received on July 3rd, 2018. The reference sample (PSRM0101, Axys ID L29347-1) was received on May 17th, 2018. Details of sample conditions upon receipt are provided on the sample receiving records. The reference material arrived at 19.7°C, exceeding the method recommendation of <4°C.

The samples were stored at -20°C in the dark prior to extraction and analysis.

SAMPLE PREPARATION AND ANALYSIS

The reference material PSRM0101 (Axys ID L29347-1) was composited and prepared for analysis as documented in the sample composite preparation records.

The rest of the solid samples were homogenized and prepared for analysis as documented in the sample homogenization records.

Extraction and analysis procedures were in general accordance with **USEPA Method 1613B**, as documented in SGS AXYS Method MLA-017: "***Analytical Method for the Determination of Polychlorinated Dibenzodioxins and Dibenzofurans by EPA Method 1613B, EPA Method 8290/8290A or EPA Method DLM02.2***". A summary of the Axys method, which includes a list of modifications to the EPA method, follows this narrative.

The samples and QC samples were analyzed in batch WG64576, the composition of which is shown on the correlation table, and on the batch list heading the extraction workup sheets. The QC samples consisted of a procedural blank, a lab-generated reference sample known as the Ongoing Precision and Recovery (OPR), and a sample duplicate. Clean sand was used as the matrix for the procedural blank and the OPR. Sample LDW18-IT45-B1-Comp1 (Axys ID L29625-1) was analyzed in duplicate and the duplicate assigned Axys ID WG64576-103.

For each sample, an accurately weighed wet subsample corresponding to approximately 10 g dry weight was spiked with ^{13}C-labeled quantification standards, and extracted in a Soxhlet apparatus with 80:20 toluene/acetone. The resulting extract was spiked with ^{13}C-labeled cleanup standards, and cleaned up using the standard chromatographic columns listed on the extraction workup sheets. The cleaned extract was concentrated and spiked with labeled recovery (internal) standard, for a final volume of 20 µL. 1 µL was injected for the DB5 column analysis, 2 µL for the DB225 column analysis.

CALCULATIONS

Target analyte concentrations were determined by isotope dilution or internal standard quantification procedures using Waters MassLynx or Micromass OPUSQuan software. The equations for calculating concentrations from the peak areas are given on page 5 of MSU-017.

The calculation of sample specific detection limits (SDLs), and the standard reporting limits, are described on pages 5-6 of MSU-017.

Homologue totals were obtained by summing the concentration of all detected congeners at each level of chlorination. Toxic Equivalents (TEQs) were calculated using WHO 2005 MAMM TEFs. The homolog total and TEQ calculations included congener peaks that did not meet the method ion abundance ratio criteria.

If the data validation chemists modified any of the concentrations, recoveries, or detection limits from as they appear on the quantification pages, these modifications are documented on the audit change reports included at the end of the analysis reports. Some of these edits may in addition be annotated by hand on the quantification pages.

REPORTING CONVENTIONS

For internal tracking, SGS AXYS assigned Windward Environmental contract number 4033. Axys logged the samples under unique laboratory identifiers of the form L29347-X or L29625-X, where X is a numeral. All data reports refer to both the client and Axys sample IDs, which are cross-referenced on the correlation table.

If a sample extract is analyzed more than once ("additional work"), a suffix is added to the Axys ID for each additional instrumental run. The additional work suffixes used in this data package are:

i	=	instrumental re-analysis
W	=	dilution

The following data qualifier flags are used in this data package:

D	=	dilution data
E	=	exceeds calibrated linear range, see dilution data
J	=	concentration less than lowest calibration equivalent
K	=	a peak was detected that did not meet all the method criteria for positive identification as the target analyte; the reported value is the estimated maximum possible concentration
U	=	not detected
X	=	the result is reported on another page

Results are reported to three significant figures, in units of nanograms per kilogram (ng/kg). The field samples were reported on a dry weight basis, while the reference sample PSRM0101 (Axys ID L29347-1) was reported on an 'as received' basis.

QA/QC NOTES

The client samples and QC samples were prepared alongside each other, and were subjected to the same analytical procedures. The client sample results were evaluated in comparison to the batch QC samples.

- The results are not blank corrected.
- The labeled surrogates ^{13}C-2,3,7,8-TCDF and ^{13}C-1,2,3,6,7,8-HxCDF produce interferences at the retention times of 1,4,7,8-TCDD and 1,2,3,4,6,8-HxCDD, respectively. The interferences were included in the homologue totals calculations and this should be considered when reviewing the sample data.
- By virtue of the isotope dilution/internal standard quantification procedures, data are recovery corrected for possible losses during extraction and cleanup.
- All initial calibration, calibration verification, procedural blank, OPR, duplicate, and labeled compound recovery specifications were met, with the following exception:

In the duplication analysis, the relative differences for 2,3,4,7,8-PeCDF, 1,2,3,6,7,8-HxCDF, and OCDF exceeded the method guideline of 40%.

ANALYTICAL DISCUSSION

All additional work performed is documented on the additional work summary included after the batch list heading the extraction workup sheets.

Most of the samples in the batch were instrumentally reanalyzed (or "reinjected") one or more times before all instrumental QC criteria were met. The reinjections are indicated by the suffixes 'i', 'i2', or 'i3' added to the Axys IDs.

Sample LDW18-IT45-B4-Comp2 (Axys ID L29625-11) required dilution for high levels of HpCDD and OCDD. OCDD, 1,2,3,4,6,7,8-HpCDD, and the total heptadioxins are reported from the dilution run (indicated by the suffix 'W' added to the Axys ID), while the remaining analytes are reported from the undiluted run.

DATA PACKAGE

This data package, assigned a unique identifier DPWG64902, includes the following:

- Puget Sound Reference material
- Method summary
- Correlation table
- Sample receiving documentation
- Sample composite preparation records
- Sample homogenization records
- Laboratory extraction workup sheets
- Sample data reports (in order of Axys ID)
- Laboratory QC data reports
- Instrumental QC data reports and mass resolution printouts (organized by analysis start date)
- Audit change reports
- Sample raw data ((in order of Axys ID)
- Laboratory QC raw data
- Instrumental QC raw data (organized by analysis start date)
- Accreditation Scope

I certify that this data package complies with the terms and conditions of the contract, both technically and for completeness, except for the conditions detailed above. In addition, I certify, that to the best of my knowledge and belief, the data as reported are true and accurate. The following signature, on behalf of SGS AXYS Analytical Services Ltd, authorizes the release of the data contained in this data package.

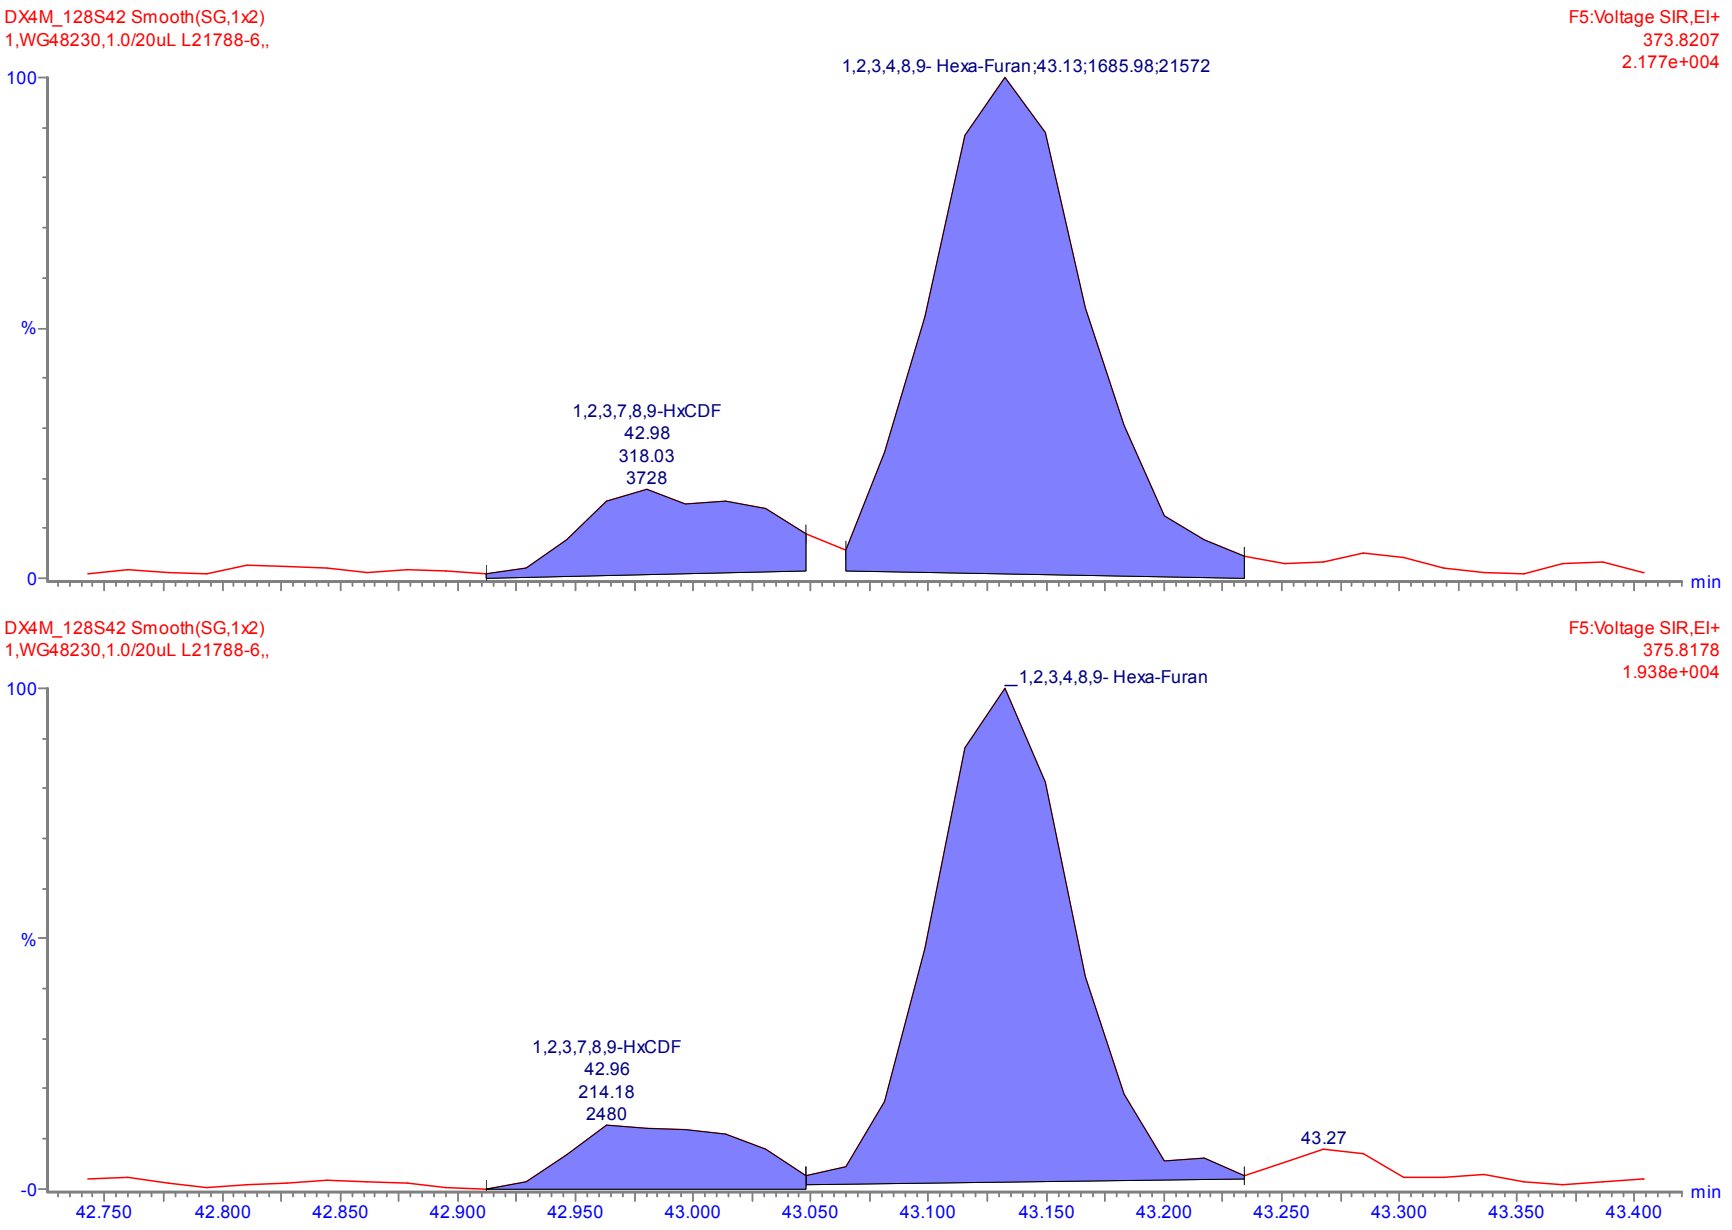
Puget Sound Reference Material ,2,3,7,8,9-HxCDF Result



The result reported for 1,2,3,7,8,9-HxCDF is consistent with the value that SGS-AXYS has determined to be present in the Puget Sound Reference Material through repetitive measurements. While the value is below the nominal guidance limit derived as +-50% of the certificate average concentration, it is within the range (concentration and statistical) determined during characterization of the material. Given that the isotope dilution method of quantification employed yields recovery corrected results, we are confident of the reliability of the SGS-AXYS result and believe that the problem relates to the certificate average concentration value, and the uniform application of a fixed +-50% guidance limit.

As documented in the Puget Sound SRM Final Technical Memorandum, the PCDDF reference values were determined from replicate test results performed by 10 independent laboratories. For 1,2,3,7,8,9-HxCDF, one non-detected result was submitted and the results for the remaining 9 replicates ranged from 0.071 to 1.16 ng/Kg, with an average value of 0.511 ng/Kg and associated standard deviation of 0.35 ng/Kg. The guidance limit of +- 50% of average concentration suggested by the supplier for this reference material is not appropriate for 1,2,3,7,8,9-HxCDF, due to the magnitude of the uncertainty in the certificate average concentration.

The peak in the chromatogram next to the 1,2,3,7,8,9-HxCDF peak is 1,2,3,4,8,9-HxCDF (chromatogram image attached). Were AXYS to perform quantification of 1,2,3,7,8,9-HxCDF on the combined areas of the 1,2,3,7,8,9/1,2,3,4,8,9-HxCDF/ peaks, the result would be 0.531 ng/Kg, which is within 4% of the average certificate value. We have concluded that many of the 10 laboratories in the study did not fully resolve 1,2,3,7,8,9-HxCDF from an interference, most likely 1,2,3,4,8,9-HxCDF.

The reference material documentation indicates the possibility of adjustment of certificate values as further data becomes available, please feel free to submit SGS-AXYS results and these comments to the QATS Program EPA Officer.

SUMMARY OF SGS AXYS METHOD MLA-017 REV. 20 VER. 10:

ANALYTICAL METHOD FOR THE DETERMINATION OF POLYCHLORINATED DIBENZODIOXINS AND DIBENZOFURANS BY EPA METHOD 1613B, 8290/8290A OR DLM02.2

SGS AXYS Method MLA-017 describes the analysis of polychlorinated (tetra-octa) dibenzo-dioxins and dibenzofurans in solids (sediment, soil, biosolid, pulp), tissues (including blood, serum, plasma and milk), aqueous samples, XAD-2 columns, air samples, particulate filters and solvent extracts.

1.0 EXTRACTION AND CLEANUP PROCEDURES

All samples are spiked with ^{13}C-labelled surrogate standards prior to extraction and extracted as per the table below. Optional extraction procedures are shown within parentheses.

Sample Extraction

Matrix	Extraction
Aqueous samples	Liquid-liquid extraction with dichloromethane. (If visible particulates are present the sample is filtered prior to extraction and the particulate fraction separately extracted by Soxhlet extraction or Dean-Stark Soxhlet extraction. The two extracts are then combined.)
Solid (sediment, soil, sludge, particles on filter paper)	Soxhlet extraction with toluene:acetone 80:20. (optional: Dean-Stark Soxhlet extraction with toluene)
Solid (pulp, black liquor)	Soxhlet extraction with toluene:acetone 80:20.
Solid (ash, slag)	Sonication with hydrochloric acid and filtering. Liquid-liquid extraction of filtrate using dichloromethane, Soxhlet extraction of particulate using toluene:acetone 80:20. The two extracts are combined.
Tissue	Soxhlet extraction with dichloromethane:hexane 1:1 (optional: Base digestion and liquid-liquid extraction with hexane)
Whole blood/serum	Liquid-liquid extraction with ethanol:hexane:saturated ammonium sulfate.
Milk	Liquid-liquid extraction with acetone and hexane.
XAD-2 column and filter	XAD-2 adsorbent is dried and Soxhlet extracted (with toluene:acetone 80:20) or Dean-Stark Soxhlet extracted (with toluene). The filter is extracted by Dean-Stark Soxhlet extraction using toluene.
Ambient air (PUF and filter)	The PUF and filter(s) are Soxhlet extracted together using toluene:acetone 80:20.
Stationary Source Air Samples (Stack Gas sample trains)	The filter is sonicated with dilute hydrochloride acid and filtered. Equipment rinsates are collected, filtered, dried and/or extracted depending on sampling conditions.

The extracts are then routinely cleaned up according to the following table:

Water Soil Sediment XAD-2 adsorbent Air samples Sludge High organic soil	(Base/acid wash →) DX $AgNO_3$ 30g 44% → (DX Florisil →) Copper → Alumina/carbon/Celite combination column
Tissue Blood/serum/ plasma Milk	(Biobead →) DX 20g 44% → DX Florisil → (Copper →) Alumina/carbon/Celite combination column

Note: Items in brackets are optional procedures that may be used if needed or if required by Project Managers.

An optional Biobead clean-up may be carried out for biosolid sample extracts.

2.0 INSTRUMENTATION

Instrumental analysis is performed on a DB-5 capillary chromatography column coupled to a high-resolution mass spectrometer (HRMS). The HRMS is operated at a static (10000) mass resolution in the voltage selected ion-recording mode (V-SIR) using selected PFK ions as a reference for mass lock. Two masses from the molecular ion cluster are used to monitor each of the target analytes and ^{13}C-labelled surrogate standards. Five chlorinated diphenylethers are monitored to check for interference using one specific ion for each compound.

A second column, DB-225, is used for confirmation/quantification of 2,3,7,8-TCDF and 1,2,3,7,8,9-HxCDD in all samples and matrices for which a peak was detected in the DB-5 run for these congeners.

Upon client request, the concentrations of PCDD/F may be determined using bracketing calibration procedures and a smaller suite of surrogate standards.

3.0 CALIBRATION

Initial calibration (default procedure) is performed using a five point calibration series of solutions that encompass the working concentration range. Initial calibration solutions contain the suite of labelled surrogate and recovery standards and authentic target PCDDs/PCDFs. Calibration is verified at least once every 12 hours by analysis of a mid-level calibration solution. Calibration procedures use the mean RRFs determined from the initial calibration to calculate analyte concentrations.

4.0 QUANTIFICATION PROCEDURES

The response for any component is taken as the sum of the integrated peak areas for the two characteristic masses for that compound. Quantification is by the isotope dilution method. Target concentrations are determined with respect to labelled surrogate standards. Mean relative response factors (RRF), determined from the multi-level initial calibration series are used to convert raw peak areas in sample chromatograms to final concentrations as follows:

$$\text{Concentration of Target} = \left(\frac{\text{area of Target}}{\text{area of Qt Std}}\right) \times \left(\frac{\text{weight of Qt Std}}{\text{RRF}}\right) \times \left(\frac{1}{\text{weight of sample}}\right)$$

$$\textit{where}\quad \text{RRF} = \left(\frac{\text{area of Target}}{\text{area of Qt Std}}\right) \times \left(\frac{\text{weight of Qt Std}}{\text{weight of Target}}\right)$$

and the Qt Std is either the surrogate or the internal standard

Those compounds quantified against a labelled standard added at the beginning of the analysis procedure are recovery corrected by the method of quantification. Surrogate recoveries are determined similarly against the recovery (internal) standard and are used as general indicators of overall analytical quality.

4.1 Reporting Limits

Concentrations and detection limits for the 2,3,7,8-polychlorinated dioxins and furans (tetra-octa) are reported. Typical reporting units for all data are pg/g, pg/L or pg/sample. Concentrations for solids are reported on a dry weight basis. Concentrations in tissues (including blood and milk) are reported on a wet weight basis and/or on a lipid weight basis when requested. Concentrations in aqueous samples are reported on a volume basis. Concentrations in XAD-2 resin, filters and stack gas samples are reported on a per sample basis or a per volume basis. Concentrations in particulate filters are reported on a per sample basis.

The following are commonly requested reporting limits:

Sample Specific Detection Limit or Sample Detection Limit (SDL) – determined individually for every sample analysis run by converting the area equivalent of 3.0 times (2.5 times for EPA 1600 series methods) the estimated chromatographic noise height to a concentration in the same manner that target peak responses are converted to final concentrations. The SDL accounts for any effect of matrix on the detection system and for recovery achieved through the analytical work-up. Equivalent term(s): Estimated Detection Limit (EDL) from EPA method 8290.

Method Detection Limit (MDL) - determined as specified by EPA Fed. Reg. 40 CFR Part 136 Appendix B (no iteration option). The 99% confidence level MDL is determined based on analysis of a minimum of 7 replicate matrix spikes fortified at 1-10 times the estimated detection limit. MDL is determined as required based on accreditation, contract and workload requirements.

Lower Method Calibration Limit (LMCL) - determined by prorating the concentration of the lowest calibration limit for sample size and extract volume. The following equation is used. ((lowest level cal conc.) x (extract volume))/sample size. Typical extract volume for PCDDs/PCDFs is 20 µL.

For the analysis of PCDDs/PCDFs SGS AXYS standard is to report sample concentrations using the SDL with a minimum reporting limit of 0.5 pg absolute.

5.0 QUALITY ACCEPTANCE CRITERIA

Samples are analyzed in batches consisting of a maximum of twenty samples, one procedural blank and one spiked matrix (OPR) sample. A duplicate is analyzed, provided there is sufficient sample, with batches containing 7-20 samples. Matrix spike/matrix spike duplicate (MS/MSD) pairs may be analyzed on an individual contract basis. The batch is carried through the complete analytical process as a unit. For sample data to be reportable, the batch QC data must meet the established acceptance criteria presented on the analysis reports.

QC Specification Table: QC Samples, Instrumental Analysis, and Analyte Quantification

QC Parameter	Specification
Analysis Duplicate	Must agree to within ±20% of the mean (applicable to concentrations >10 times the DL)[1]
Procedural Blank	**Blood/serum/plasma and milk:** TCDD/F <0.2 pg/sample, PeCDD/F <0.5 pg/sample, HxCDD/F and HpCDD/F <1.0 pg/ sample, OCDD/F<5 pg/sample. **Other matrices:** TCDD/F <0.5 pg/sample, PeCDD/F, HxCDD/F, HpCDD/F <1.0 pg/sample, OCDD/F <5 pg/sample. Higher levels acceptable where all sample concentrations are > 10X the blank concentrations.
Detection Limit	SDL Requirements (where target concentrations are detectable or sample extracts display atypical interference, SDL values may be higher): **Blood/serum/plasma and milk:** Tetra-penta-CDD/F 0.2 pg/sample, Hexa-octa-CDD/F 0.5 pg/sample **Other matrices**: 0.5 pg/sample
Instrument Carry over and Background: **Toluene Blank** **Samples**	A. 1st toluene blank following Cal Ver must have <0.6 pg TCDD and <25 pg OCDD[2]. B. 2nd toluene blank following Cal Ver must have <0.2 pg TCDD/F, <0.8 pg Pe-HpCDD/F, and <5.0 pg OCDD[2]. Blood/serum/plasma and milk extract analysis: As many toluene blanks as necessary are run to achieve an instrument blank level of <0.1 pg TCDD/F, <0.3 pg PeCDD/F, <0.5 pg HxCDD/F, <0.5 pg HpCDD/F and <3.5 pg OCDD. <10% contribution from preceding sample (based on observed instrument carryover rate).
Analyte Peak Response	Response must be below the upper calibrated range of the instrument. Data may be taken from more than one chromatogram to get the responses in the calibrated range.
Ion Ratios	Must be within ±15% of theoretical. For 1613B applications only (as per section 16.3 of 1613B) an alternate acceptance criteria of within ±10% of the ratio in the midpoint calibration (CS3) or calibration verification (Cal Ver), whichever is most recent., may be applied. Exception for blood/serum/plasma samples: Ion ratios for sample responses below the lowest calibration level equivalent must be within ±35% of theoretical.
Sensitivity	S:N ≥10:1 for all compounds in CS-0.2 for 1.0 µL injected, plus for blood/serum/plasma and milk S:N ≥3:1 for 0.05 pg injected 2,3,7,8-TCDD.

[1] Duplicate criterion is a guideline; final assessment depends upon sample characteristics, overall batch QC and on-going lab performance.

[2] Instrument background specifications are calculated from spiking labelled standard into the toluene blank and expressed as pg in a 20 µL extract.

Modifications to EPA Method 1613B

The following sections of EPA Method 1613B have been modified as described below.

Section 2.1.2

Aqueous liquid from multiphase samples is liquid/liquid extracted with DCM. The extract from the aqueous phase is then combined with the extract from the solid phase portion of the sample.

Section 7.2.1
